

RH Freemint Hunter

Automatic NFT mint hunter for Robinhood Chain

User manual · Version 1.0

1. What this program does

It watches for new NFT collections launching on Robinhood Chain and mints the ones worth having, automatically. Some free mints sell out within minutes, which is why a program does this better than a person watching a screen.

It follows the same four steps every time:

```
Find new and upcoming drops
|
Decide whether each one qualifies
|
Check you have not already minted it
|
Mint one, and write down what happened
```

It starts in Practice Mode

The program does everything except actually spend money. You can run it, watch it work, and understand it before any real money is involved.

2. Installing it

There is no installer. Put `RH-Freemint-Hunter.exe` in a folder of its own — for example `Documents\NFT Hunter\` — and double-click it.

Your web browser opens the dashboard automatically. Nothing else appears - there is no console window to leave open.

"Windows protected your PC"

Windows shows this for any program it has not seen before. It is not a virus warning. Click **More info**, then **Run anyway**.

How to close it

Use the **Quit app** button at the top right of the dashboard. Closing the browser tab does not stop the program - the browser is only a remote control, and the bot keeps running behind it.

Files it creates beside the program

File	What it holds
<code>.env</code>	Your settings, including your wallet key. Never share this file.
<code>data\mits.json</code>	A record of everything it has minted
<code>hunter.log</code>	A full activity log. Useful if something goes wrong, since it survives after the program closes.

3. The dashboard

Tab	What it shows
Dashboard	Whether it is running, your wallet, your rules, and what is opening soon
Drops found	Every collection it examined, and whether it qualified
My mints	What you actually minted
Activity	A live feed of what it is doing right now
Settings	Everything you can change

The coloured bar is the important part

Green — PRACTICE MODE

The bot only pretends to mint. Nothing is spent. Completely safe.

Red — LIVE MODE

The bot can spend real money from your wallet.

Trust the coloured bar over anything else on screen. It reflects what the program is really doing.

Three buttons, three different things

Button	What it does
Start hunting	Begins watching for drops
Stop	Stops watching. The program stays open.
Quit app	Closes the program completely

4. The rules it follows

```
Is the mint free?
  |
YES --+-- always qualifies
  |
NO  --+-- qualifies only if BOTH:
          credibility score is 75 or higher
          price is under your limit
```

What the credibility score means

A number out of 100, worked out from things the program can verify itself on the blockchain:

- Has the project published its contract code for anyone to inspect?
- Does it have proper artwork and description set up?
- Are creator royalties configured?
- Does it have real holders, or nobody?
- Is the collection size sensible?
- Is the mint window a reasonable length?
- Is the name a placeholder like "test"?

A serious project scores high. A thrown-together scam scores low.

Free mints skip the score on purpose

A free mint costs only the transaction fee — under one cent. The score exists to protect you from *paying* for something worthless, so it is not applied when nothing is being paid.

Changing the rules

On the Dashboard tab there is a slider for the score and a box for the price limit. As you move them, a line underneath tells you what would change, based on drops it has already seen — so you can see the effect before committing.

Nothing is saved until you press **Apply new rules**.

Setting	Guidance
Minimum credibility	75 is a sensible start. Below 60 starts letting in unverified projects with no real holders.
Max price per mint	Your real spending protection. Keep it low. Set it to 0 for free mints only.

5. Using your own currency

Under **Settings** → **Rules** → **Currency** there are 35 currencies, including Sri Lankan Rupee, Indian Rupee, Euro, Pound and Dirham.

When you change currency, your price limit is **converted automatically** so it stays worth the same amount. A limit of \$1 becomes about Rs 332 — not "1 rupee". A line under the dropdown shows the new figure before you save.

6. Using it with real money

Take these in order. Do not skip step 3.

- 1 **Make a burner wallet.** A brand-new wallet used only for this program. Never your main wallet.
- 2 **Put a small amount in it.** 0.001 ETH on Robinhood Chain is about \$2 and covers roughly 200 mints. This is the most you can lose.
- 3 **Watch it in Practice Mode first.** With money in the wallet but Practice Mode still on, the program does everything short of sending. If the Activity tab shows lines beginning `[DRY RUN] would mint`, then everything works.
- 4 **Then go live.** Press Stop. In Settings, untick Practice Mode. Save. Press Start hunting. The bar turns red.

Sensible limits for your first live run

Max price per mint **0** (free only) · Max mints per run **1** · Gas budget **0.0005 ETH**

It will mint exactly one free NFT and stop, so you can check the result before letting it run freely.

Please read this once

This program spends real money without asking each time — that is the whole point of it. Your protection is the limits you set, and the burner wallet holding only what you can afford to lose.

A free mint still costs a transaction fee, and the NFT it collects may turn out to be worth nothing. Nobody can promise otherwise.

7. Running it in the background

Once you trust it, double-click `Start-Hidden.vbs` instead of the `.exe`. The program runs invisibly — no black window at all.

To close it then, use the **Quit app** button on the dashboard. That is the only way to stop it when there is no window.

Starting it automatically when the computer turns on

1. Press `Windows key + R`
2. Type `shell:startup` and press Enter
3. Put a shortcut to `Start-Hidden.vbs` into the folder that opens

8. When something looks wrong

What you see	What it means
"Windows protected your PC"	Normal for a new program. More info → Run anyway.
Double-clicking does nothing	It is already running - open <code>http://127.0.0.1:4663</code> . If the browser does not open either, check <code>hunter.log</code> .
Browser says it cannot reach the page	Wait ten seconds and refresh. If it still fails, the program has closed - check <code>hunter.log</code> .
"NOT CONNECTED" in red	The program has closed. Start it again, then reload the page. <code>hunter.log</code> says why it stopped.
Nothing in "Drops found"	Normal when nobody is launching. Check the Activity tab to confirm it is working.
"Simulation reverted"	It tried a mint that would have failed and backed out before spending. Working correctly.
A drop was skipped	The reason is in the Eligible column on Drops found — usually price or score.
"Scanner has not run for..."	A scanner stalled. Press Stop, then Start hunting.

9. Keeping yourself safe

- Stay in Practice Mode until you understand what it does.
- Use a burner wallet with small amounts. Never your main wallet.
- Your `.env` file contains your private key. Anyone who gets it controls that wallet. Never send it to anyone, and never post a screenshot of the Settings page.
- The dashboard is only reachable from your own computer. Keep it that way.
- `hunter.log` records what the program did. It contains no keys, so it is safe to share when asking for help.
- Keep the price limit low. It is what stands between you and an expensive mistake.
